

Technical support for Your laboratory

– Your safeguard in keeping laboratory equipment running

Cedrex A/S has through the years kept its focus on the automation of laboratories in the biotechnological and pharmaceutical branches.

Now we are able to make servicecontracts about the technical management, support and maintenance of laboratories.

Several steps will be examined when forming the contract: Our engineers gathers and registers the data concerning the machines as well as the equipment in the laboratory. The laborants and possible other users will be consulted during this proces which will ensure that all knowledge and experience will be gathered. It will be collected in a "Laboratory manual".

The Laboratory manual

The information and data will be structured in what we refer to as a Laboratory Manual, which will be designed to fulfill the requirements set forth in the Machinery Directive 98/37/EEC.

In conjunction with this work we will make a general assesment of any repetitive operations and the possibility of removing these by utilising equipment from our line of products.

In addition to dealing with the service and automation issues safety will be handled as well. We make an evaluation of the safety in which guards and screens, emergency switches and related components will be evaluated. In this way the laboratory manual will form a complete documentation in compliance with the Machinery Directive.

The manual will act as a tool to be used by technicians who has to be able to gain swift acces to information regarding machines and equipment, while it will form a source of reference material to the daily users of the laboratory and the equipment. Additionally it is a part of the general CE-approval of the laboratory.
